Assignment 3 - More Pandas

This assignment requires more individual learning than the last one did - you are encouraged to check out the [pandas documentation \(http://pandas.pydata.org/pandas-docs/stable/\)](http://pandas.pydata.org/pandas-docs/stable/) to find functions or methods you might not have used yet, or ask questions on [Stack Overflow \(http://stackoverflow.com/\)](http://stackoverflow.com/) and tag them as pandas and python related. And of course, the discussion forums are open for interaction with your peers and the course staff.

Question 1 (20%)

Load the energy data from the file `Energy Indicators.xls`, which is a list of indicators of energy supply and renewable electricity production (Energy%20Indicators.xls) from the United Nations (http://unstats.un.org/unsd/environment/excel_file_tables/2013/Energy%20Indicators.xls) for the year 2013, and should be put into a DataFrame with the variable name of **energy**.

Keep in mind that this is an Excel file, and not a comma separated values file. Also, make sure to exclude the footer and header information from the datafile. The first two columns are unnecessary, so you should get rid of them, and you should change the column labels so that the columns are:

```
['Country', 'Energy Supply', 'Energy Supply per Capita', '% Renewable']
```

Convert Energy Supply to gigajoules (there are 1,000,000 gigajoules in a petajoule). For all countries which have missing data (e.g. data with "...") make sure this is reflected as `np.NaN` values.

Rename the following list of countries (for use in later questions):

```
"Republic of Korea": "South Korea",
"United States of America": "United States",
"United Kingdom of Great Britain and Northern Ireland": "United Kingdom",
"China, Hong Kong Special Administrative Region": "Hong Kong"
```

There are also several countries with numbers and/or parenthesis in their name. Be sure to remove these,

e.g.

```
'Bolivia (Plurinational State of)' should be 'Bolivia',
```

```
'Switzerland17' should be 'Switzerland'.
```

Next, load the GDP data from the file `world_bank.csv`, which is a csv containing countries' GDP from 1960 to 2015 from World Bank (<http://data.worldbank.org/indicator/NY.GDP.MKTP.CD>). Call this DataFrame **GDP**.

Make sure to skip the header, and rename the following list of countries:

```
"Korea, Rep.": "South Korea",
"Iran, Islamic Rep.": "Iran",
"Hong Kong SAR, China": "Hong Kong"
```

Finally, load the Scimago Journal and Country Rank data for Energy Engineering and Power Technology (<http://www.scimagojr.com/countryrank.php?category=2102>) from the file `scimagojr-3.xlsx`, which ranks countries based on their journal contributions in the aforementioned area. Call this DataFrame **ScimEn**.

Join the three datasets: GDP, Energy, and ScimEn into a new dataset (using the intersection of country names). Use only the last 10 years (2006-2015) of GDP data and only the top 15 countries by Scimagojr 'Rank' (Rank 1 through 15).

The index of this DataFrame should be the name of the country, and the columns should be ['Rank', 'Documents', 'Citable documents', 'Citations', 'Self-citations', 'Citations per document', 'H index', 'Energy Supply', 'Energy Supply per Capita', '% Renewable', '2006', '2007', '2008', '2009', '2010', '2011', '2012', '2013', '2014', '2015'].

This function should return a DataFrame with 20 columns and 15 entries.

```

In [54]: import pandas as pd
import numpy as np
energy = pd.read_excel('Energy Indicators.xls')

energy = energy[16:243]
energy = energy.drop(energy.columns[[0,1]], axis=1)
energy.rename(columns={'Environmental Indicators: Energy': 'Country', 'Unnamed: 3': 'Energy Supply', 'Unnamed: 4': 'Energy Supply per Capita', 'Unnamed: 5': '% Renewable'}, inplace=True)
energy.replace('...', np.nan, inplace = True)
energy['Energy Supply'] *= 1000000
def rem_digit(x):
    Data = ''.join([i for i in x if not i.isdigit()])
    i = Data.find('(')
    if i>-1: Data = Data[:i]
    return Data.strip()

energy['Country'] = energy['Country'].apply(rem_digit)

abc = {"Republic of Korea": "South Korea",
"United States of America": "United States",
"United Kingdom of Great Britain and Northern Ireland": "United Kingdom",
"China, Hong Kong Special Administrative Region": "Hong Kong"}
energy.replace({"Country":abc}, inplace=True)

GDP = pd.read_csv('world_bank.csv', skiprows=4)

GDP.rename(columns={'Country Name': 'Country'}, inplace = True)

di = {"Korea, Rep.": "South Korea",
"Iran, Islamic Rep.": "Iran",
"Hong Kong SAR, China": "Hong Kong"}

GDP.replace({"Country": di},inplace = True)

ScimEn = pd.read_excel('scimagojr-3.xlsx')

dataframe = pd.merge(pd.merge(energy, GDP, on='Country'), ScimEn, on='Country')

dataframe.set_index('Country',inplace=True)

dataframe = dataframe[['Rank', 'Documents', 'Citable documents', 'Citations', 'Self-citations', 'Citations per document', 'H index', 'Energy Supply', 'Energy Supply per Capita', '% Renewable', '2006', '2007', '2008', '2009', '2010', '2011', '2012', '2013', '2014', '2015']]

dataframe = (dataframe.loc[dataframe['Rank'].isin([1,2,3,4,5,6,7,8,9,10,11,12,13,14,15])])

dataframe = dataframe.sort_values('Rank',ascending=True).astype(float)

def answer_one():
    return dataframe
answer_one()

```

Question 5 (6.6%)

What is the mean Energy Supply per Capita?

This function should return a single number.

```
In [64]: def answer_five():
          Top15 = answer_one()
          return Top15['Energy Supply per Capita'].mean()

          answer_five()
```

```
Out[64]: 157.6
```

Question 6 (6.6%)

What country has the maximum % Renewable and what is the percentage?

This function should return a tuple with the name of the country and the percentage.

```
In [63]: def answer_six():
          Top15 = answer_one()
          return Top15['% Renewable'].idxmax(), Top15['% Renewable'].max()

          answer_six()
```

```
Out[63]: ('Brazil', 69.648030000000006)
```

Question 7 (6.6%)

Create a new column that is the ratio of Self-Citations to Total Citations. What is the maximum value for this new column, and what country has the highest ratio?

This function should return a tuple with the name of the country and the ratio.

```
In [62]: def answer_seven():
         Top15 = answer_one()
         Top15['Ratio'] = Top15['Self-citations']/Top15['Citations']
         return Top15['Ratio'].idxmax(), Top15['Ratio'].max()
         answer_seven()
```

```
Out[62]: ('China', 0.68931261793894216)
```

Question 8 (6.6%)

Create a column that estimates the population using Energy Supply and Energy Supply per capita. What is the third most populous country according to this estimate?

This function should return a single string value.

```
In [55]: def answer_eight():
         Top15 = answer_one()
         Top15['PopEst'] = Top15['Energy Supply']/Top15['Energy Supply per Capita']
         return Top15.sort_values(by='PopEst', ascending=False).iloc[2].name
         answer_eight()
```

```
Out[55]: 'United States'
```

Question 9 (6.6%)

Create a column that estimates the number of citable documents per person. What is the correlation between the number of citable documents per capita and the energy supply per capita? Use the `.corr()` method, (Pearson's correlation).

This function should return a single number.

(Optional: Use the built-in function `plot9()` to visualize the relationship between Energy Supply per Capita vs. Citable docs per Capita)

```
In [56]: def answer_nine():
         Top15 = answer_one()
         Top15['Energy Supply per Capita'].astype('float64')
         Top15['PopEst'] = (Top15['Energy Supply']/Top15['Energy Supply per Capita']).astype(float)
         Top15['citeDocPerPerson'] = Top15['Citable documents']/Top15['PopEst']
         return Top15[['Energy Supply per Capita', 'citeDocPerPerson']].corr().ix['Energy Supply p
         er Capita', 'citeDocPerPerson']
         answer_nine()
```

Optional

Use the built in function `plot_optional()` to see an example visualization.

```
In [61]: def plot_optional():
import matplotlib as plt
%matplotlib inline
Top15 = answer_one()
ax = Top15.plot(x='Rank', y='% Renewable', kind='scatter',
               c=['#e41a1c', '#377eb8', '#e41a1c', '#4daf4a', '#4daf4a', '#377eb8', '#4daf4a',
                 '#e41a1c',
                 '#4daf4a', '#e41a1c', '#4daf4a', '#4daf4a', '#e41a1c', '#dede00', '#ff7f00'
               ],
               xticks=range(1,16), s=6*Top15['2014']/10**10, alpha=.75, figsize=[16,6]);

for i, txt in enumerate(Top15.index):
    ax.annotate(txt, [Top15['Rank'][i], Top15['% Renewable'][i]], ha='center')

print("This is an example of a visualization that can be created to help understand the data. \
This is a bubble chart showing % Renewable vs. Rank. The size of the bubble corresponds to the countries' \
2014 GDP, and the color corresponds to the continent.")
plot_optional()
```

This is an example of a visualization that can be created to help understand the data. This is a bubble chart showing % Renewable vs. Rank. The size of the bubble corresponds to the countries' 2014 GDP, and the color corresponds to the continent.
